

Standardization

WHAT IS A STANDARD?

A standard is a document designed for a voluntary use which contains technical specifications based on the results of experience and technological development. Standards result from consensus among all interested and involved parties in a certain activity and must be approved by a recognized standardization body.

Standards assure certain quality and safety levels which enable any organization to get a better position in the market. Standards are an important source of information for professionals of any economic sector.

There are UNE standards for almost every product, service and process:

Management systems

Raw materials

Industrial products and equipment

Construction

Consumer goods (electronics, household appliances, toys, furniture, footwear, childcare...)

Tourism and leisure time

Sport facilities and equipment

Food products

Health

Transport

Energy management

Accessibility

R&D and innovation

Information technology

Logistics

Social responsibility
